

Bike Infrastructure Makes Roads Safer for Everyone

The introduction of bike infrastructure to an area provides benefits for people walking, biking and driving. Specifically with protected bike lanes, which can reduce injury crashes by 40% and increase red light compliance up to 94%. Increased infrastructure increases the number of people choosing to ride bikes while reducing crashes.

Increased cycling improves health, which reduces healthcare costs for people and companies while reducing traffic congestion and pollution. The majority of people who live near protected lanes, and bike trails support more infrastructure and experience an increase in property value.
